ABSTRACT OF THE DISCLOSURE

Sub
A1

A luminescence device is principally constituted by a pair of electrodes and an organic compound layer disposed therebetween. The layer
5 contains a metal coordination compound represented by the following formula (1):

wherein M denotes Ir, Rh or Pd; n is 2 or 3; CyN
10 denotes a substituted or unsubstituted cyclic group containing a nitrogen atom connected to M and capable of containing another nitrogen atom and/or a sulfur atom; and CyC denotes a substituted or unsubstituted
15 cyclic group containing a carbon atom connected to M and capable of containing a nitrogen atom and/or a sulfur atom, CyN and CyC being connected to each other via a covalent bond, and each of substituents for CyN and CyC being selected from the group consisting of a
20 halogen atom; nitro group; a trialkylsilyl group containing three linear or branched alkyl groups each independently having 1 - 8 carbon atoms; and a linear or branched alkyl group having 1 - 20 carbon atoms
capable of including one or at least two non-
neighboring methylene groups which can be replaced
25 with -O-, -S-, -CO-, -CO-O-, -O-CO-, -CH=CH- or -C≡C- and capable of including a hydrogen atom which can be replaced with a fluorine atom; with the proviso that a
